Repair Methodology to be followed

The Methodology for the Repair of Columns, Beams And Slabs.

The damages have been classified in the following four categories.

1 Severe:

The members under these categories are badly affected. Multiple very wide structural cracks more than 70 percent were observed. The reinforcement in the members is heavily corroded and visible as the cover at most of the places had fallen out. The NDT result of these structural members also show that strength of concrete has been in the category of heavily deteriorated category.

2 Medium:

The structural members placed in this category are having multiple cracks to the tune of 30percent. The reinforcement in these members is also corroded causing spalling of concrete at various locations and loose chunks of concrete come out easily on hitting with a metallic hammer. The NDT result of these members shows the quality of concrete has been in the category of 'Doubtful'.

3 Mild:

Small size Structural and non-structural cracks are observed in these members. The NDT result of these members corresponds to the quality of concrete to be fair. The corrosion in the reinforcement of these is started and needs attention

4 No Damaged/ Repaired:

No visual damage was observed; the structural members seem to be OK, due to repair by the maintenance division in the past.

Three different repair methodologies are being suggested for the repair of the columns. The '**Repair Methodology-1**' is suggested for the '**Severely**' damaged columns. The '**Repair Methodology-2**' is suggested for the repair of columns in which **Medium** and **Mild** category type of damages. '**Repair Methodology-3**; is suggested for the repair of externally located damaged beams, and chajjas. These methodologies are as detailed below:

Repair Methodology-1

This repair methodology includes,

- Supporting the Structure,
- Removal of unsound concrete from the affected area,
- Protective treatment to the existing steel reinforcement,
- Addition of the reinforcement steel where the area of the steel is reduced to more than 10 percent,
- Repairs using single component high strength polymer modified mortar or using high strength free flow micro concrete,
- Strengthening of the member using E-Glass or Carbon fiber wrapping,

1) Supporting the Structure.

Providing and erecting steel props (about 14' height, braced at the center and supporting a continuous 2'' x 3'' wooden runner, resisting on the wedge and block minimum capacity 3 Ton) to support the structure provisionally during repair and jacketing etc. and maintaining them in position till required as directed by IIT Delhi. It is the responsibility of the contractor or applicator to provide appropriate shoring and provide proper jacks to de-stress the structure, before taking up the repair and retrofitting.

2) Removal of Unsound Concrete from Affected Area:

The First step in preparing reinforcing steel for repair or cleaning is removing the deteriorated concrete surrounding the reinforcement. Care should be used to ensure that further damage to the reinforcing steel is not caused by the process of removing the concrete. Impact breakers can heavily damage reinforcing steel if the breaker is used without regard to the location of the reinforcement. For this reason, a cover meter or reinforcing bar locator should be used to determine the depth, size, quantity, and approximate location of the reinforcement in the concrete. Once the larger area of unsound concrete has been removed, a smaller chipping hammer should be used to remove the concrete in the vicinity of the reinforcement. Care should be taken not to vibrate the reinforcement or otherwise cause damage to its bond to concrete adjacent to the repair area. No reinforcing bar is to be cut or removed without the approval of the engineer. All weak, damaged, and easily removable concrete should be chipped away. If the reinforcing bars are only exposed after all unsound concrete is removed, it may not be necessary to remove additional concrete to expose the full circumference of the reinforcement.

When the exposed reinforcing steel has loose rust, corrosion products, or is not well bonded to

the surrounding concrete, the concrete removal should continue to create a clear space behind the reinforcing steel of 6 mm (0.25 in.) , plus the dimension of the maximum size aggregate of the repair material.

3) Application of concrete penetrating corrosion inhibitor on concrete surface:

Carry out application of 'Bi-polar migratory corrosion inhibitor on concrete surface by brush in two coats. This inhibitor has migratory kind of property which permits the materials to migrate to a virtual extent of 60 mm, through pores of concrete, inhibiting the corrosion and de-passivating the electro-chemical reaction. It has property to attack anode as well as cathode, which is purely alkaline in nature (pH-9.5), so it has no carcinogen activity with concrete. Material shall have evaluated test reports indicating significant reduction in corrosion rate indicative of its suitability for tropical applications. Grout 50 to 75 mm deep holes at the spacing of 350 mm c/c with the dosing of 100 ml per hole in concrete body.

4) Providing Additional Reinforcing Steel :

Makeup lost steel area due to corrosion by providing additional steel reinforcement. The steel shall conform to IS 1786 grade Fe500D. Anchor the steel rebar in sound concrete body up to desired depth by structural GRADE adhesive. Fixing of rebars is to be with pre left binding wires with existing steel at regular grid after aligning concrete profile with new mortar up to existing steel face.

5) Strengthening the Columns, Beams & Slabs

i) Making Up Lost Strength of Core Concrete by Low Viscosity Monomer:

Make up to lost strength of core concrete shall be with grouting of low viscosity (2-5cps- as per ASTM-D-2196) monomer. This is a low viscous high molecular weight thermosetting polymer. Due to its low viscosity it effectively fills up all micro-cracks and voids up to full depth of concrete. Beside enhancing existing binding matrix this shall also enhance in ductility property of elements.

Description of Grout:

- Drilling of holes 12 mm dia. And about 1/3 rd of element deep into concrete along the cracks or in honey combed and deteriorated areas, fix the perforated nozzles, and seal the sides with Epoxy sealant.
- Epoxy sealant: This is a non-shrink sealant. It is built in resilience to absorb impact and movements in joints.
- Inject very low viscous injection resin into pre-drilled nozzles at a pressure of 4-10 kg/cm² or as instructed by engineer-in-charge using compressed air and injecting gun. Seal the nozzles with epoxy after injection is completed.

ii) **Grouting of Structural Cracks by Low Viscosity Epoxy Grout:** Grout the wide structural cracks in the concrete by grouting of low viscosity grout (200 cps as per ASTM-D-2196). Cut a V-groove along the crack of proportionate size. Drill the holes along the crack at desired spacing. Seal the remaining portion by no-shrink epoxy putty to avoid any leakages of grout material. Grout the low viscosity material through epoxy injection gun under pressure of 3 to 4 kg/ cm². Cut and seal the nozzles after 24 hrs of application of grouting.

iii) Sectional Reconstruction in Excessively Damaged Concrete in Structural Elements

a.) Bonding Coat:

Bond between new and old concrete is important aspect for effective participation of total cross sectional area of concrete. Selection of type of bond coat is based on, type of stresses bond strata is expected to go, and prevailing area where application is to be carried. After the various pre-treatment apply liberal quantity of bond coat on cleaned concrete surfaces as per the detailed manufacture's procedure. Ensure that the application of new concreting is carried out during the pot life of material.

b). Making up lost- section with free flow micro concrete:

For replacing the carbonated part of concrete and repairing the damaged surface of concrete, fix the form work across the profile of damaged structural element. Pour the free flow concrete mix in the form work. Makeup concrete is based on type of structural element and its location. For large replacement of damaged concrete the free flow type of micro-concrete can be used. For small patch works the latex modified mortars can be used.

c.) Making up lost- section with latex modified mortar:

Makeup mortar is based on type of structural element and its location. Here following type of modified mortars are recommended.

Modified mortar:

For replacing the carbonated part of concrete and repairing the damaged surface of concrete usage of following formulated mortar is recommended.

Mix:

- Cement: 50 Kg
- Sand: 150 Kg
- Monobond: 2.5 to 5 kg
- Water: 15-20 Liters.

6) Strengthening of the member using E-Glass or Carbon fiber wrapping: Methodology for wrap System- Fiber Wrapping Technique:

The fiber wrapping technique of retrofitting is relatively new technique. It has got certain wrapping technique of retrofitting is relative ease for application, high strength to weight ratio, energy, and time saving, clean and noise free application, high strength to weight ratio, energy, and time saving, clean, and noise free application. The fiber wrapping system offers resistance to corrosion of reinforcement also. The fiber wrap skin acts as a deterrent to environmental degradation. It also has tailor ability to adapt to any shape of substrate concrete.

The following are the steps taken for Fiber Wrapping:

1. The contact surface of concrete element shall not have free moisture at the time of application.
2. All bare concrete surfaces to be strengthened shall be primed with epoxy primer using a roller brush. Any surface concavity is to be filled by epoxy or other suitable putty.
3. Apply saturate epoxy on the surface.
4. Stretch unidirectional glass fiber over the surface and press by rollers to squeeze out the saturant through the fabric. Air bubbles are also removed due to this operation. ... indicated the general direction of fiber for beams in flexure and shear, and columns in confinement. The wrapping around the beam-column joints are shown....
5. The fibers of the composite shall be lapped at least 150 mm in the direction of fiber between adjacent layers.
6. The process is repeated (steps6- 7) for application of second layer.
7. For the elements exposed to sunlight, a sealer coat may be applied on the wrap.

Protective Measure against Deterioration of building due to corrosion of Reinforcement:

The following treatment is general is recommended for the affected concrete members:

- The loose and disintegrated concrete be removed.
- The concrete surface should be thoroughly scrubbed by hard steel wire brush to ensure that no loose mortar, disintegrated concrete or concrete lumps are left. The scrubbed surface should then be cleaned by washing with water and made free of dust particles. Preferably by blowing air under pressure.
- Apply the bond coat of Epoxy coating on the entire surface, to have proper bond in between the old concrete and mortar.
- Make the column with polymer modified cement mortar when the bond coat is tacky. Cement: sand mortar (1:3) used shall have 20% acrylic emulsion by weight of cement. It shall be cured for 7 days by sprinkling water.
- In case the concrete member is in good condition but there are small cracks or undulations, the cracks, joints, or undulations are repaired using epoxy sealant .

The Following is the Detailed Procedure for Fiber Wrapping:

1. **Structure Preparation:**
Basic repairs must be made to the structure prior to strengthening with FRP. Spelled concrete removed, Corroded or damaged steel addressed major cracks injected. Build the surface with polymer modified mortar or micro concrete.
2. **Surface Preparation:**
The surface to be repaired is typically rubbed off to smooth out irregularities remove contaminants and radius sharp corners. This can be performed by shot or sand blasting, water jet or grinder
3. **Primer:**

In order to promote adhesion and prevent the surface from drawing resin from the FRP, a low viscosity epoxy primer is applied with a roller until the substrate is locally saturated.

4. **Putty**
Adhesive, high viscosity putty is applied when necessary to the surface to fill in 'bug holes' offset or voids.
5. **Cutting Fabric:**
In a clean area away from the resins, the fabric is carefully measured and cut in accordance with the specifications.
6. **Saturating Fabric:**
On large, high volume projects, the fabric can be saturated using custom saturator. For lower volumes and shorter strips, the fabric can be either saturated on a table, or the surface can be coated with resin and the dry fabric applied.
7. **Applying Fabric:**
The pre-wetted, or dry, fabric is carefully laid onto the surface and smoothed out to remove air bubbles and ensure that the fibers are straight.
8. **Quality Control Monitoring:**
During the cure, 2 to 6 hours depending on ambient conditions, the fabric is checked to ensure that all air bubbles are removed and that the fabric is not sagging.
9. **Applying Second Saturate Coat & Sand Pasting:**
After inspection of wrapped fiber apply second coat of saturate on wrap and apply subsequent layer as per design. Apply coarse river sand if wrapping is followed by plastering or POP when second coat becomes tacky.
10. **Applying Bond Coat & Plastering:**
Apply compatible bond coat on wrapped surfaces and carrying out plastering with rich cement mortar.
11. **Applying Top Coat For Exposed Surface:**
Apply compatible UV resistant polyurethane top coat on wrapped surfaces in case of wrapping surfaces are exposed to direct sun light and wrapped surfaces are not plastered.

Repair Methodology-2:

This repair methodology is for the columns whose damage level is classified as "Mild" and "Moderate", which includes:

Supporting the structure.

Removal of unsound concrete from the affected area,

Protective treatment to the existing steel reinforcement.

Addition of the reinforcing steel, if required.

Building up the columns with high strength free-flow micro concrete,

1. In the above methodology the steps: I, ii, iii, and iv are the same as those explained in Repair "Methodology-1",
2. Here jacketing of the columns is recommended with high strength free flow micro-concrete (strength not less than 50 MPa) right from the foundation level to make up the concrete that was lost due to delamination or chipping.
3. The specifications for the micro-concrete are explained in the item itself.
4. Fiber wrapping is not required for the columns whose damage is classified as "Mild" and "Moderate".
